The Mission of WantToKnow.info:

*To provide our readers with reliable, verifiable information on major cover-ups,
and to serve as a call to work together for the good of all*

"As it turns out, we are injecting our children with 400 times the amount of mercury that FDA or EPA considers safe. A child on his [first day that he is born](#) is injected with a hepatitis B shot. Under EPA guidelines, he would have to be 275 pounds to safely absorb that shot." ~~ Robert F. Kennedy, Jr. in [MSNBC interview](#) on vaccine-autism-mercury link, 6/22/05

"The disease [autism] was unknown until 1943, when it was identified and diagnosed among 11 children born in the months after thimerosal was first added to baby vaccines in 1931." ~~ Robert F. Kennedy, Jr. in suppressed article below

Dear friends,

Has mercury in vaccines played a part in the rapid rise of autism? **The below article by highly respected attorney [Robert F. Kennedy, Jr.](#), discusses U.S. government documents obtained through the Freedom of Information Act (FOIA) which clearly show that government agencies like the FDA and CDC have consciously concealed solid evidence of a link between mercury in vaccines and the rise in autism.** Just skimming the few sections highlighted in bold below will show you how profit and greed may have created much unnecessary suffering in our children.

Though an MSNBC interview available at [this link](#) covered some of Kennedy's concerns about a link between mercury in vaccines and autism, no other major news media have shown interest in [Kennedy's research](#). And even the MSNBC interview completely avoided his solid evidence

drawn from declassified government documents which leave no doubt as to a major cover-up of this critical issue. Why wouldn't the mainstream news media cover this [solid evidence of a cover-up](#)?

The author, whose father Robert F. Kennedy was assassinated, originally had this revealing article posted on the websites of both *Rolling Stone* ([archived link here](#)) and [salon.com](#) in 2005 ([archived version here](#)). Several major [alternative news websites](#) also picked up the article. **Yet with no logical reason, all of these websites several years later deleted the article, so that it is now difficult to find online.** Kennedy discusses this in [an article](#) on his World Mercury Project website.

Vaccines in the U.S. are [regulated by the FDA](#), the same body that [fired whistleblowers](#) who exposed critical dangers of genetically engineered food and [hired a former biotech lawyer](#) as a chief monitor and regulator of biotech industries. You can help on this topic which is so critical to our children's health by sharing this vital information with your friends and colleagues. Together, we can and will build a brighter future for ourselves and our children.

With best wishes for a transformed world,
Fred Burks for [WantToKnow.info](#)
Former [White House interpreter](#) and [whistleblower](#)

Note: Concise summaries of the few major media articles which have explored solid evidence on the link between vaccines and autism are included below Kennedy's article. Links are included to the original articles, which include one inspiring article describing an autism treatment which has had considerable success. And note that as of 2017, the [CDC states](#) that the mercury derivative thimerosal is still being used in flu vaccines.

Deadly Immunity

by Robert F. Kennedy Jr.

In June 2000, a group of top government scientists and health officials gathered for a meeting at the isolated Simpsonwood conference center in Norcross, Ga. Convened by the Centers for Disease Control and Prevention, the meeting was held at this Methodist retreat center, nestled in wooded farmland next to the Chattahoochee River, to ensure complete secrecy.

The agency had issued no public announcement of the session – only private invitations to 52 attendees. There were high-level officials from the CDC and the Food and Drug Administration, the top vaccine specialist from the World Health Organization in Geneva, and representatives of every major vaccine manufacturer, including GlaxoSmithKline, Merck, Wyeth and Aventis Pasteur. All of the scientific data under discussion, CDC officials repeatedly reminded the participants, was strictly "embargoed." There would be no making photocopies of documents, no taking papers with them when they left.

The federal officials and industry representatives had assembled to discuss a disturbing new study that raised alarming questions about the safety of a host of common childhood vaccines administered to infants and young children. According to a CDC epidemiologist named Tom Verstraeten, who had analyzed the agency's massive database containing the medical records of 100,000 children, a mercury-based preservative in the vaccines –

thimerosal – appeared to be responsible for a dramatic increase in autism and a host of other neurological disorders among children.

"I was actually stunned by what I saw," Verstraeten told those assembled at Simpsonwood, citing the staggering number of earlier studies that indicate a link between thimerosal and speech delays, attention-deficit disorder, hyperactivity and autism. Since 1991, when the CDC and the FDA had recommended that three additional vaccines laced with the preservative be given to extremely young infants – in one case, within hours of birth – the estimated number of cases of autism had increased fifteenfold, from one in every 2,500 children to one in 166 children.

Even for scientists and doctors accustomed to confronting issues of life and death, the findings were frightening. "You can play with this all you want," Dr. Bill Weil, a consultant for the American Academy of Pediatrics, told the group. The results "are statistically significant." Dr. Richard Johnston, an immunologist and pediatrician from the University of Colorado whose grandson had been born early on the morning of the meeting's first day, was even more alarmed. "My gut feeling?" he said. "Forgive this personal comment – I do not want my grandson to get a thimerosal-containing vaccine until we know better what is going on."

But instead of taking immediate steps to alert the public and rid the vaccine supply of thimerosal, the officials and executives at Simpsonwood spent most of the next two days discussing how to cover up the damaging data. According to transcripts obtained under the Freedom of Information Act, many at the meeting were concerned about how the damaging revelations about thimerosal would affect the vaccine industry's bottom line.

"We are in a bad position from the standpoint of defending any lawsuits," said Dr. Robert Brent, a pediatrician at the Alfred I. duPont Hospital for Children in Delaware. "This will be a resource to our very busy plaintiff attorneys in this country." Dr. Bob Chen, head of vaccine safety for the CDC, expressed relief that "given the sensitivity of the information, we have been able to keep it out of the hands of, let's say, less responsible hands." Dr. John Clements, vaccines advisor at the World Health Organization, declared flatly that the study "should not have been done at all" and warned that the results "will be taken by others and will be used in ways beyond the control of this group. The research results have to be handled."

In fact, the government has proved to be far more adept at handling the damage than at protecting children's health. The CDC paid the Institute of Medicine to conduct a new study to whitewash the risks of thimerosal, ordering researchers to "rule out" the chemical's link to autism.

It withheld Verstraeten's findings, even though they had been slated for immediate publication, and told other scientists that his original data had been "lost" and could not be replicated. And to thwart the Freedom of Information Act, it handed its giant database of vaccine records over to a private company, declaring it off-limits to researchers. By the time Verstraeten finally published his study in 2003, he had gone to work for GlaxoSmithKline and reworked his data to bury the link between thimerosal and autism.

Vaccine manufacturers had already begun to phase thimerosal out of injections given to American infants – but they continued to sell off their mercury-based supplies of vaccines until last year. The CDC and FDA gave them a hand, buying up the tainted vaccines for export to developing countries and allowing drug companies to continue using the preservative in some American vaccines – including several pediatric flu shots as well as tetanus boosters routinely given to 11-year-olds.

The drug companies are also getting help from powerful lawmakers in Washington. Senate Majority Leader Bill Frist, who has received \$873,000 in contributions from the pharmaceutical industry, has been working to immunize vaccine makers from liability in 4,200 lawsuits that have been filed by the parents of injured children. On five separate occasions, Frist has tried to seal all of the government's vaccine-related documents – including the Simpsonwood transcripts – and shield Eli Lilly, the developer of thimerosal, from subpoenas.

In 2002, the day after Frist quietly slipped a rider known as the "Eli Lilly Protection Act" into a homeland security bill, the company contributed \$10,000 to his campaign and bought 5,000 copies of his book on bioterrorism. Congress repealed the measure in 2003 – but earlier this year, Frist slipped another provision into an anti-terrorism bill that would deny compensation to children suffering from vaccine-related brain disorders. "The lawsuits are of such magnitude that they could put vaccine producers out of business and limit our capacity to deal with a biological attack by terrorists," says Andy Olsen, a legislative assistant to Frist.

Even many conservatives are shocked by the government's effort to cover up the dangers of thimerosal. Rep. Dan Burton, a Republican from Indiana, oversaw a three-year investigation of thimerosal after his grandson was diagnosed with autism. "Thimerosal used as a preservative in vaccines is directly related to the autism epidemic," his House Government Reform Committee concluded in its final report. "This epidemic in all probability may have been prevented or curtailed had the FDA not been asleep at the switch regarding a lack of safety data regarding injected thimerosal, a known neurotoxin." The FDA and other public-health agencies failed to act, the committee added, out of "institutional malfeasance for self protection" and "misplaced protectionism of the pharmaceutical industry."

The story of how government health agencies colluded with Big Pharma to hide the risks of thimerosal from the public is a chilling case study of institutional arrogance, power and greed. I was drawn into the controversy only reluctantly. As an attorney and environmentalist who has spent years working on issues of mercury toxicity, I frequently met mothers of autistic children who were absolutely convinced that their kids had been injured by vaccines.

Privately, I was skeptical. I doubted that autism could be blamed on a single source, and I certainly understood the government's need to reassure parents that vaccinations are safe; the eradication of deadly childhood diseases depends on it. I tended to agree with skeptics like Rep. Henry Waxman, a Democrat from California, who criticized his colleagues on the House Government Reform Committee for leaping to conclusions about autism and vaccinations. "Why should we scare people about immunization," Waxman pointed out at one hearing, "until we know the facts?"

It was only after reading the Simpsonwood transcripts, studying the leading scientific research and talking with many of the nation's preeminent authorities on mercury that I became convinced that the link between thimerosal and the epidemic of childhood neurological disorders is real. Five of my own children are members of the Thimerosal Generation – those born between 1989 and 2003 – who received heavy doses of mercury from vaccines. "The elementary grades are overwhelmed with children who have symptoms of neurological or immune-system damage,"

Patti White, a school nurse, told the House Government Reform Committee in 1999. "Vaccines are supposed to be making us healthier; however, in 25 years of nursing I have never seen so many damaged, sick kids. Something very, very wrong is happening to our children." **More than 500,000 kids currently suffer from autism, and pediatricians diagnose more than 40,000 new cases every year. The disease was unknown until 1943, when it was identified and**

diagnosed among 11 children born in the months after thimerosal was first added to baby vaccines in 1931.

Some skeptics dispute that the rise in autism is caused by thimerosal-tainted vaccinations. They argue that the increase is a result of better diagnosis – a theory that seems questionable at best, given that most of the new cases of autism are clustered within a single generation of children. "If the epidemic is truly an artifact of poor diagnosis," scoffs Dr. Boyd Haley, one of the world's authorities on mercury toxicity, "then where are all the 20-year-old autistics?"

Other researchers point out that Americans are exposed to a greater cumulative "load" of mercury than ever before, from contaminated fish to dental fillings, and suggest that thimerosal in vaccines may be only part of a much larger problem. It's a concern that certainly deserves far more attention than it has received – but it overlooks the fact that the mercury concentrations in vaccines dwarf other sources of exposure to our children.

What is most striking is the lengths to which many of the leading detectives have gone to ignore – and cover up – the evidence against thimerosal. From the very beginning, the scientific case against the mercury additive has been overwhelming. The preservative, which is used to stem fungi and bacterial growth in vaccines, contains ethylmercury, a potent neurotoxin.

Truckloads of studies have shown that mercury tends to accumulate in the brains of primates and other animals after they are injected with vaccines – and that the developing brains of infants are particularly susceptible. In 1977, a Russian study found that adults exposed to much lower concentrations of ethylmercury than those given to American children still suffered brain damage years later. **Russia banned thimerosal from children's vaccines 20 years ago, and Denmark, Austria, Japan, Great Britain and all the Scandinavian countries have since followed suit.**

"You couldn't even construct a study that shows thimerosal is safe," says Haley, who heads the chemistry department at the University of Kentucky. "It's just too darn toxic. If you inject thimerosal into an animal, its brain will sicken. If you apply it to living tissue, the cells die. If you put it in a petri dish, the culture dies. Knowing these things, it would be shocking if one could inject it into an infant without causing damage."

Internal documents reveal that Eli Lilly, which first developed thimerosal, knew from the start that its product could cause damage – and even death – in both animals and humans. In 1930, the company tested thimerosal by administering it to 22 patients with terminal meningitis, all of whom died within weeks of being injected – a fact Lilly didn't bother to report in its study declaring thimerosal safe. In 1935, researchers at another vaccine manufacturer, Pittman-Moore, warned Lilly that its claims about thimerosal's safety "did not check with ours." Half the dogs Pittman injected with thimerosal-based vaccines became sick, leading researchers there to declare the preservative "unsatisfactory as a serum intended for use on dogs."

In the decades that followed, the evidence against thimerosal continued to mount. During the Second World War, when the Department of Defense used the preservative in vaccines on soldiers, it required Lilly to label it "poison." In 1967, a study in Applied Microbiology found that thimerosal killed mice when added to injected vaccines. Four years later, Lilly's own studies discerned that thimerosal was "toxic to tissue cells" in concentrations as low as one part per million – 100 times weaker than the concentration in a typical vaccine. Even so, the company continued to promote thimerosal as "nontoxic" and also incorporated it into topical disinfectants. In 1977, 10 babies at a Toronto hospital died when an antiseptic preserved with thimerosal was dabbed onto their umbilical cords.

In 1982, the FDA proposed a ban on over-the-counter products that contained thimerosal, and in 1991 the agency considered banning it from animal vaccines. But tragically, that same year, the CDC recommended that infants be injected with a series of mercury-laced vaccines. Newborns would be vaccinated for hepatitis B within 24 hours of birth, and 2-month-old infants would be immunized for haemophilus influenzae B and diphtheria-tetanus-pertussis.

The drug industry knew the additional vaccines posed a danger. The same year that the CDC approved the new vaccines, Dr. Maurice Hilleman, one of the fathers of Merck's vaccine programs, warned the company that 6-month-olds who were administered the shots would suffer dangerous exposure to mercury. He recommended that thimerosal be discontinued, "especially when used on infants and children," noting that the industry knew of nontoxic alternatives. "The best way to go," he added, "is to switch to dispensing the actual vaccines without adding preservatives."

[Important Note: For a stunning admission by Dr. Hilleman that AIDS was knowingly imported to the US by pharmaceutical companies, see this shocking [10-minute video](#).]

For Merck and other drug companies, however, the obstacle was money. Thimerosal enables the pharmaceutical industry to package vaccines in vials that contain multiple doses, which require additional protection because they are more easily contaminated by multiple needle entries. The larger vials cost half as much to produce as smaller, single-dose vials, making it cheaper for international agencies to distribute them to impoverished regions at risk of epidemics.

Faced with this "cost consideration," Merck ignored Hilleman's warnings, and government officials continued to push more and more thimerosal-based vaccines for children. **Before 1989, American preschoolers received only three vaccinations – for polio, diphtheria-tetanus-pertussis and measles-mumps-rubella. A decade later, thanks to federal recommendations, children were receiving a total of 22 immunizations by the time they reached first grade.**

As the number of vaccines increased, the rate of autism among children exploded. During the 1990s, 40 million children were injected with thimerosal-based vaccines, receiving unprecedented levels of mercury during a period critical for brain development. Despite the well-documented dangers of thimerosal, it appears that no one bothered to add up the cumulative dose of mercury that children would receive from the mandated vaccines. "What took the FDA so long to do the calculations?" Peter Patriarca, director of viral products for the agency, asked in an e-mail to the CDC in 1999. "Why didn't CDC and the advisory bodies do these calculations when they rapidly expanded the childhood immunization schedule?"

But by that time, the damage was done. Infants who received all their vaccines, plus boosters, by the age of 6 months were being injected with levels of ethylmercury 187 times greater than the EPA's limit for daily exposure to methylmercury, a related neurotoxin. Although the vaccine industry insists that ethylmercury poses little danger because it breaks down rapidly and is removed by the body, several studies – including one published in April by the National Institutes of Health – suggest that ethylmercury is actually more toxic to developing brains and stays in the brain longer than methylmercury.

Officials responsible for childhood immunizations insist that the additional vaccines were necessary to protect infants from disease and that thimerosal is still essential in developing nations, which, they often claim, cannot afford the single-dose vials that don't require a preservative. Dr. Paul Offit, one of CDC's top vaccine advisors, told me, "I think if we really have

an influenza pandemic – and certainly we will in the next 20 years, because we always do – there's no way on God's earth that we immunize 280 million people with single-dose vials. There has to be multidose vials."

[Note: A [CBS News article](#) titled "How Independent Are Vaccine Defenders?" reports on a comment by Dr. Offit that babies can tolerate "10,000 vaccines at once."]

But while public-health officials may have been well-intentioned, many of those on the CDC advisory committee who backed the additional vaccines had close ties to the industry. Dr. Sam Katz, the committee's chair, was a paid consultant for most of the major vaccine makers and shares a patent on a measles vaccine with Merck, which also manufactures the hepatitis B vaccine. Dr. Neal Halsey, another committee member, worked as a researcher for the vaccine companies and received honoraria from Abbott Labs for his research on the hepatitis B vaccine.

Indeed, in the tight circle of scientists who work on vaccines, such conflicts of interest are common. Rep. Burton says that the CDC "routinely allows scientists with blatant conflicts of interest to serve on intellectual advisory committees that make recommendations on new vaccines," even though they have "interests in the products and companies for which they are supposed to be providing unbiased oversight." The House Government Reform Committee discovered that four of the eight CDC advisors who approved guidelines for a rotavirus vaccine laced with thimerosal "had financial ties to the pharmaceutical companies that were developing different versions of the vaccine."

Offit, who shares a patent on the vaccine, acknowledged to me that he "would make money" if his vote to approve it eventually leads to a marketable product. But he dismissed my suggestion that a scientist's direct financial stake in CDC approval might bias his judgment. "It provides no conflict for me," he insists. "I have simply been informed by the process, not corrupted by it. When I sat around that table, my sole intent was trying to make recommendations that best benefited the children in this country. It's offensive to say that physicians and public-health people are in the pocket of industry and thus are making decisions that they know are unsafe for children. It's just not the way it works."

Other vaccine scientists and regulators gave me similar assurances. Like Offit, they view themselves as enlightened guardians of children's health, proud of their "partnerships" with pharmaceutical companies, immune to the seductions of personal profit, besieged by irrational activists whose anti-vaccine campaigns are endangering children's health. They are often resentful of questioning. "Science," says Offit, "is best left to scientists."

Still, some government officials were alarmed by the apparent conflicts of interest. In his e-mail to CDC administrators in 1999, Paul Patriarca of the FDA blasted federal regulators for failing to adequately scrutinize the danger posed by the added baby vaccines. "I'm not sure there will be an easy way out of the potential perception that the FDA, CDC and immunization-policy bodies may have been asleep at the switch re: thimerosal until now," Patriarca wrote. The close ties between regulatory officials and the pharmaceutical industry, he added, "will also raise questions about various advisory bodies regarding aggressive recommendations for use" of thimerosal in child vaccines.

If federal regulators and government scientists failed to grasp the potential risks of thimerosal over the years, no one could claim ignorance after the secret meeting at Simpsonwood. But rather than conduct more studies to test the link to autism and other forms of brain damage, the CDC placed politics over science. The agency turned its database on childhood vaccines – which had been developed largely at taxpayer expense

– over to a private agency, America's Health Insurance Plans, ensuring that it could not be used for additional research. It also instructed the Institute of Medicine, an advisory organization that is part of the National Academy of Sciences, to produce a study debunking the link between thimerosal and brain disorders.

The CDC "wants us to declare, well, that these things are pretty safe," Dr. Marie McCormick, who chaired the IOM's Immunization Safety Review Committee, told her fellow researchers when they first met in January 2001. "We are not ever going to come down that [autism] is a true side effect" of thimerosal exposure. According to transcripts of the meeting, the committee's chief staffer, Kathleen Stratton, predicted that the IOM would conclude that the evidence was "inadequate to accept or reject a causal relation" between thimerosal and autism. That, she added, was the result "Walt wants" – a reference to Dr. Walter Orenstein, director of the National Immunization Program for the CDC.

For those who had devoted their lives to promoting vaccination, the revelations about thimerosal threatened to undermine everything they had worked for. "We've got a dragon by the tail here," said Dr. Michael Kaback, another committee member. "The more negative that [our] presentation is, the less likely people are to use vaccination, immunization – and we know what the results of that will be. We are kind of caught in a trap. How we work our way out of the trap, I think is the charge."

Even in public, federal officials made it clear that their primary goal in studying thimerosal was to dispel doubts about vaccines. "Four current studies are taking place to rule out the proposed link between autism and thimerosal," Dr. Gordon Douglas, then-director of strategic planning for vaccine research at the National Institutes of Health, assured a Princeton University gathering in May 2001. "In order to undo the harmful effects of research claiming to link the [measles] vaccine to an elevated risk of autism, we need to conduct and publicize additional studies to assure parents of safety." Douglas formerly served as president of vaccinations for Merck, where he ignored warnings about thimerosal's risks.

In May of last year, the Institute of Medicine issued its final report. Its conclusion: There is no proven link between autism and thimerosal in vaccines. Rather than reviewing the large body of literature describing the toxicity of thimerosal, the report relied on four disastrously flawed epidemiological studies examining European countries, where children received much smaller doses of thimerosal than American kids.

It also cited a new version of the Verstraeten study, published in the journal *Pediatrics*, that had been reworked to reduce the link between thimerosal and autism. The new study included children too young to have been diagnosed with autism and overlooked others who showed signs of the disease. The IOM declared the case closed and – in a startling position for a scientific body – recommended that no further research be conducted.

The report may have satisfied the CDC, but it convinced no one. Rep. David Weldon, a Republican physician from Florida who serves on the House Government Reform Committee, attacked the Institute of Medicine, saying it relied on a handful of studies that were "fatally flawed" by "poor design" and failed to represent "all the available scientific and medical research." CDC officials are not interested in an honest search for the truth, Weldon told me, because "an association between vaccines and autism would force them to admit that their policies irreparably damaged thousands of children. Who would want to make that conclusion about themselves?"

Under pressure from Congress, parents and a few of its own panel members, the Institute of Medicine reluctantly convened a second panel to review the findings of the first. In February, the

new panel, composed of different scientists, criticized the earlier panel for its lack of transparency and urged the CDC to make its vaccine database available to the public.

So far, though, only two scientists have managed to gain access. Dr. Mark Geier, president of the Genetics Center of America, and his son, David, spent a year battling to obtain the medical records from the CDC. Since August 2002, when members of Congress pressured the agency to turn over the data, the Geiers have completed six studies that demonstrate a powerful correlation between thimerosal and neurological damage in children.

One study, which compares the cumulative dose of mercury received by children born between 1981 and 1985 with those born between 1990 and 1996, found a "very significant relationship" between autism and vaccines. Another study of educational performance found that kids who received higher doses of thimerosal in vaccines were nearly three times as likely to be diagnosed with autism and more than three times as likely to suffer from speech disorders and mental retardation. Another soon-to-be-published study shows that autism rates are in decline following the recent elimination of thimerosal from most vaccines.

As the federal government worked to prevent scientists from studying vaccines, others have stepped in to study the link to autism. In April, reporter Dan Olmsted of UPI undertook [one of the more interesting studies](#) himself. Searching for children who had not been exposed to mercury in vaccines – the kind of population that scientists typically use as a "control" in experiments – **Olmsted scoured the Amish of Lancaster County, Penn., who refuse to immunize their infants. Given the national rate of autism, Olmsted calculated that there should be 130 autistics among the Amish. He found only four. One had been exposed to high levels of mercury from a power plant. The other three – including one child adopted from outside the Amish community – had received their vaccines.**

At the state level, many officials have also conducted in-depth reviews of thimerosal. While the Institute of Medicine was busy whitewashing the risks, the Iowa Legislature was carefully combing through all of the available scientific and biological data.

"After three years of review, I became convinced there was sufficient credible research to show a link between mercury and the increased incidences in autism," says state Sen. Ken Veenstra, a Republican who oversaw the investigation. "The fact that Iowa's 700 percent increase in autism began in the 1990s, right after more and more vaccines were added to the children's vaccine schedules, is solid evidence alone." Last year, Iowa became the first state to ban mercury in vaccines, followed by California. Similar bans are now under consideration in 32 other states.

But instead of following suit, the FDA continues to allow manufacturers to include thimerosal in scores of over-the-counter medications as well as steroids and injected collagen. Even more alarming, **the government continues to ship vaccines preserved with thimerosal to developing countries – some of which are now experiencing a sudden explosion in autism rates. In China, where the disease was virtually unknown prior to the introduction of thimerosal by U.S. drug manufacturers in 1999, news reports indicate that there are now more than 1.8 million autistics.**

Although reliable numbers are hard to come by, autistic disorders also appear to be soaring in India, Argentina, Nicaragua and other developing countries that are now using thimerosal-laced vaccines. The World Health Organization continues to insist thimerosal is safe, but it promises to keep the possibility that it is linked to neurological disorders "under review."

I devoted time to study this issue because I believe that this is a moral crisis that must be addressed. **If, as the evidence suggests, our public-health authorities knowingly allowed the pharmaceutical industry to poison an entire generation of American children, their actions arguably constitute one of the biggest scandals in the annals of American medicine.** "The CDC is guilty of incompetence and gross negligence," says Mark Blaxill, vice president of Safe Minds, a nonprofit organization concerned about the role of mercury in medicines. "The damage caused by vaccine exposure is massive. It's bigger than asbestos, bigger than tobacco, bigger than anything you've ever seen."

It's hard to calculate the damage to our country – and to the international efforts to eradicate epidemic diseases – if Third World nations come to believe that America's most heralded foreign-aid initiative is poisoning their children. It's not difficult to predict how this scenario will be interpreted by America's enemies abroad. The scientists and researchers – many of them sincere, even idealistic – who are participating in efforts to hide the science on thimerosal claim that they are trying to advance the lofty goal of protecting children in developing nations from disease pandemics. They are badly misguided. Their failure to come clean on thimerosal will come back horribly to haunt our country and the world's poorest populations.

Robert F. Kennedy Jr. is senior attorney for the Natural Resources Defense Council, chief prosecuting attorney for Riverkeeper and president of Waterkeeper Alliance. He also helped form [The World Mercury Project](#), which is dedicated to educating the public on these hidden matters.

Original article [available here](#). Below are excerpts from other revealing articles on this topic.

Scandal Exposed in Major Study of Autism and Mercury
Sacramento Bee (Leading newspaper in California's capital city), October 25, 2011
<http://www.sacbee.com/2011/10/25/4005040/scandal-exposed-in-major-study.html>

The Coalition for Mercury-free Drugs (CoMeD) exposes communications between Centers for Disease Control (CDC) personnel and vaccine researchers revealing **U.S. officials apparently colluded in covering-up the decline in Denmark's autism rates following the removal of mercury from vaccines.** Documents obtained via the Freedom of Information Act (FOIA) show that CDC officials were aware of Danish data indicating a connection between removing Thimerosal (49.55% mercury) and a decline in autism rates. Despite this knowledge, these officials allowed a 2003 article to be published in Pediatrics that excluded this information, misrepresented the decline as an increase, and led to the mistaken conclusion that Thimerosal in vaccines does not cause autism.

Note: For the complete text of the article, which has strangely been taken down from the *Sacramento Bee* website, [click here](#). And read about a key scientific study which showed that monkeys given standard human vaccines developed autism symptoms at [this link](#).

Possible Mercury, Autism Connection Found in Study
Los Angeles Times, March 17, 2005
<http://www.latimes.com/news/science/la-sci-autism17mar17,1,1770760.story>

Studying individual school districts in Texas, the epidemiologists found that those districts with the highest levels of mercury in the environment also had the highest rates of special education

students and autism diagnoses. **There was a strong, direct relationship between mercury and autism levels. The incidence of autism has grown dramatically over the last two decades, from about one in every 2,000 children to as high as one in every 166.** The purported link between autism and mercury has been a subject of intense debate. In the past it has centered primarily on the mercury-containing preservative thimerosal, which was once widely used in vaccines. Many parents have argued that thimerosal causes autism because their children seemed to develop the neurological disorder shortly after they received childhood vaccinations.

Swine flu vaccine 'linked to' sleeping disorder
The Telegraph (One of the UK's leading newspapers), March 29, 2012
<http://www.telegraph.co.uk/health/healthnews/9171414/Swine-flu-vaccine...>

A study in Finland has found that children vaccinated against the H1N1 swine flu virus with Pandemrix were more likely to develop the sleep disorder narcolepsy. The condition causes excessive daytime sleepiness and sufferers can fall asleep suddenly and unintentionally. **The researchers found that between 2002 and 2009, before the swine flu pandemic struck, the rate of narcolepsy in children under the age of 17 was 0.31 per 100,000. In 2010 this was about 17 times higher at 5.3 per 100,000.** Pandemrix was the main vaccine used in Britain against the swine flu epidemic in which six million people were vaccinated.

The Age of Autism: The Amish anomaly
***Washington Times*/UPI,** April 18-19, 2005
<http://www.washtimes.com/upi-breaking/20050321-115921-9566r.htm>

Where are the autistic Amish? In Lancaster County, heart of Pennsylvania Dutch country, there should be well over 100 with some form of the disorder. There is evidence of only three. Julia is one of them. She ... is adopted from China. She had most of her vaccines given to her in the United States. [Of the other, one definitely had a vaccine, and the other's vaccine status is unknown.] Thousands of children cared for by Homefirst Health Services in metropolitan Chicago have at least two things in common with thousands of Amish children in rural Lancaster: They have never been vaccinated. And they don't have autism. **"We have about 30,000 or 35,000 children that we've taken care of over the years, and I don't think we have a single case of autism in children delivered by us who never received vaccines," said Dr. Mayer Eisenstein, Homefirst's medical director.** Eisenstein, in fact, is author of the book "Don't Vaccinate Before You Educate!" Earlier this year Florida pediatrician Dr. Jeff Bradstreet said there is virtually no autism in home-schooling families who decline to vaccinate for religious reasons – lending credence to Eisenstein's observations. "It's largely non-existent," said Bradstreet, who treats children with autism from around the country. Thimerosal, which is 49.6 percent ethyl mercury by weight, was phased out of most U.S. childhood immunizations beginning in 1999, but the CDC recommends flu shots for pregnant women and last year began recommending them for children 6 to 23 months old. Most of those shots contain thimerosal.

Debate over vaccines, autism won't die
MSNBC, June 26, 2005
<http://msnbc.msn.com/id/8336821>

The afternoon after Kelly Kerns' 2-month-old daughter Kaylee got several vaccines was "living hell," with the child screaming and arching her back, her mother said. 'I kept telling myself everybody gets vaccinated – this is OK,' she said. When Kaylee was 18 months old, her white-blond hair began falling out and she stopped talking. Meanwhile, Kerns had twin boys – Andrew and Daniel. When they were 15 months old, they received three vaccines. A week later, they stopped talking. All three children have since been diagnosed as autistic. Flu vaccine sold in multidose vials still contains the preservative, and the government urges flu shots for pregnant women and young children even though not enough thimerosal-free ones are available, critics say. Finding answers is tough because autism, a little-understood developmental disorder, often is diagnosed at the very ages when children get vaccines. **The stories are remarkably similar: A seemingly normal child gets a shot and days, weeks or months later, withdraws from the world, stops speaking, becomes upset at random stimulation such as a doorbell, and adopts compulsive behaviors like head-banging.**

Note: Thimerosal has now been removed from childhood vaccines, however the government and drug industry continue to deny that there is any link between mercury in vaccines and autism. And mercury is still commonly used in flu and other vaccines in the U.S.

A child's return from autism
May 25, 2005, *San Francisco Chronicle*
<http://sfgate.com/cgi-bin/article.cgi?f=/c/a/2005/05/25/BAGU0CU2K71.DTL>

A Lafayette couple, certain that chelation therapy has helped their autistic son, stepped squarely into the controversy surrounding the causes of autism and its treatment Tuesday as they joined 150 other parents in launching an international support group that will aggressively promote the treatment. **The Handleys are now among a small minority of parents – who, believing that the autism was caused by the mercury in thimerosal, a preservative that was routinely used in vaccines until recently – are treating their children with chelation therapy, a lotion or pill that strips the body of heavy metals.** It has been used for decades to detoxify people contaminated in industrial accidents, but no studies have proved whether it is an effective treatment for autism. For Jamie's parents, the proof they need is in front of them: Jamie, now 3 years old and several months into treatment, is plump and playing baseball. His smile has returned. The Handleys said the new support group, Generation Rescue, and its Web site, www.generationrescue.com, will offer information on chelation therapy and connect parents with those who can help.

Note: For concise summaries of 20 excellent major media articles revealing vaccine dangers and a possible link between mercury in vaccines and autism, [click here](#).

What you can do:

- Inform your media and political representatives of this important information on the link between mercury in vaccines and autism. To contact those close to you, [click here](#).
- Learn more about major health cover-ups which put your health at risk and other ways to improve your health in [this lesson](#) from the free [Insight Course](#).
- Read concise summaries of revealing major media reports on vaccines, autism [available here](#).
- Visit our Health Information Center at www.WantToKnow.info/healthinformation.
- Spread this news on vaccines, autism, and mercury to your friends and colleagues, and bookmark this article on key social networking websites using the "Share" icon on this page, so that we can fill the role at which the major media is sadly failing. Together, we can make a difference.

Finding Balance: WantToKnow.info Inspiration Center

WantToKnow.info believes it is important to balance disturbing cover-up information with inspirational writings which call us to be all that we can be and to work together for positive change. For an abundance of uplifting material, please visit our [Inspiration Center](#).
